

The main factor to think about is that since cloud instances are transient and untrustworthy, you can go about leaving your important information like your Play Store service account JSON or your iTunes distribution certificate on the server.

Continuous Integration (CI) systems, like Cirrus typically support encrypted setting variables to store personal data.

Take adequate precautions to not echo those variable values back onto the console in your test scripts. Those variables are not offered in pull requests till they're merged to make sure that malicious actors cannot produce a pull request that prints these secrets out. Take care of interactions with these secrets in pull requests that you just settle for and merge. **d**
