

A flutter, with a big impact

Cross-platform app development frameworks are a dime-a-dozen and every now and then we get a new framework that takes the world by storm. React Native was all the rage up until two years ago and now, it seems Google's own Flutter is hogging all the limelight. Google publicly released the alpha version of Flutter at Google I/O 2017 and since then it's improved by leaps and bounds. It's open-source and in these two years it has even managed to enter the Top 50 most active repos on GitHub. Flutter is all about making your apps look pretty and having a small footprint. While it did start off with support for iOS and Android apps, it has since then evolved to support desktop as well as embedded platforms.

Flutter is more than just a simple wrapper around an HTML app as is the case with a lot of cross-platform SDKs. It performs its own UI drawing so you get a consistent look across platforms. All the programming in Flutter is done in Dart, which is also a Google product that is comparable to the likes of Swift and Kotlin.

All this aside, the biggest factor that makes Flutter a platform of choice is the fact that it is considered to be a part and parcel of Google Fuschia. For those living under a rock. Fuschia is Google's cross-platform operating system that's still under development. One that is seen as an easy replacement for Android and ChromeOS in the near future. Moreover, Google is allegedly also focusing on IoT platforms with Fuschia. So developing apps
