

is automatically created in the Code Editor. Here, you need to remove some code as per your need, you need to add some new code according to the requirement of your app, or you may need to modify the existing code. Sometimes, you need to paste some code in the editor. So while performing these changes, you will find that the indentation of the code has been distorted. This creates a big problem for the developer. The Flutter tools provide options to fix this problem automatically. If you are using Android Studio, right-click the editor and select “Reformat Code with dartfmt” from the

drop-down list. If you are using Visual studio code, right-click the editor and select “Format Document”. You can also run the “flutter format <file-name>” command from the command prompt to reformat the content of the file with accurate indentation.

If you do not have expertise in dart programming at this time, you need not worry. If you have a programming background and you know any of the object-oriented programming languages like C++ or Java, you can develop Flutter apps very easily as the syntax of the dart programming language is similar to other object-oriented programming languages.

You have successfully developed a simple Flutter Calculator app. You will find that the look and the functionality of the app are very basic and simple. So gear up and get your hands dirty fine-tuning the app. **d**
