

Layout tutorial

Step 1:

Creating the app base code and breaking the layout to its basic elements

Start by creating a basic 'hello world' flutter app.

- Change the app bar title as per requirements
- Diagram the layout and identify the areas that need padding, alignment or borders.
- Diagram each row –
 1. Title section –
it has a column of text, a star icon , and a number.
 2. Button section –
it has 3 children, each a column with an icon and text.

Step 2:

Implementing the title row

- Build the left column in the title section.
- Add the required code on top of the MyApp class build() method
- Put a Column inside an expanded widget to stretch the column for using the remaining free space in the row.
- Put the first row of text inside a Container so that you can add padding. The second child in the Column (text) displays itself in grey.
- The last two items in the title row are a red star icon and the text “41”. The row is in a Container and padded by 32 pixels along each edge.
- Add the title section to the body app according to your requirements.
- Fix your indentation in your Flutter editor using the automatic reformatting support.
- To experience faster development, you can try the hot reload feature of flutter.

'Hello world' flutter app
