

- Put the definition of the text section as a variable. Like before, the text is to be put in a Container and padding is to be added along each edge.
- Add the necessary code just below the button section declaration.
- The next step is to set `softwrap` to `true`. This makes sure that the text lines will fill the column width before wrapping at a word boundary.
- Finally, the text section can be added to the body.

Step 5:

Implementing the image section

Now that you have already completed three out of the four-column elements, only the image part is left.

- The first step would be to create an images directory at the top of the project.
- Add your desired image to the body in the format `xyz.jpg`.
- To include an `asset` tag, you have to update the `pubspec.yaml` file. This ends up making the image accessible to your code.
- Now you can reference the image from your code.
- After the above steps, the `BoxFit.cover` tells the framework that the image should cover its entire render box, but it should be as small as possible.

Example of basic Flutter layout

Step 6:

The final Midas Touch

- In the conclusive step to finish your layout, arrange all of the four elements in a `ListView` rather than a `Column` view. This is suggested because when the app is run on a smaller device, `ListView` is equipped to support the app body scrolling in a smooth manner.
- And you are done! Now when you hot reload the app, you should be able to see a proper app layout that you so diligently built on your own.
- After you are done plotting the layout of your app, you can easily make
