

#### WhatsApp messaging App

```

• class WhatsAppClone extends StatelessWidget {
•   @override
•   Widget build(BuildContext context) {
•     return MaterialApp(
•       title: 'WhatsApp',
•       theme: ThemeData(
•         primaryColor: Color(0xff075e54),
•         indicatorColor: Colors.white,
•         primaryColorDark: Color(0xFF128C7E),
•         primaryIconTheme: IconThemeData(
•           color: Colors.white,
•         ),
•       textTheme: TextTheme(
•         title: TextStyle(color: Colors.white),
•       ),
•     ),
•     home: Home(),
•     // closing tags below

```

By using theme widgets, it is easier for you to define a particular font style and color for the application. Although `primaryColor` and `PrimaryIconTheme` are easy to understand, `indicatorColor` and other elements are a bit tougher to discern.

### Now, comes the setting of TabView

Creating a TabView with Flutter is quick and easy. Flutter has a section
