

WhatsApp AppBar customisation

Incorporating an essential part – Chat

WhatsApp is a messaging chat app, so, it makes sense to give it an utmost importance while developing for a clone app. While you are on a path to developing it, assume it as a chore in the CSS flex-box layout. You get it right and easy.

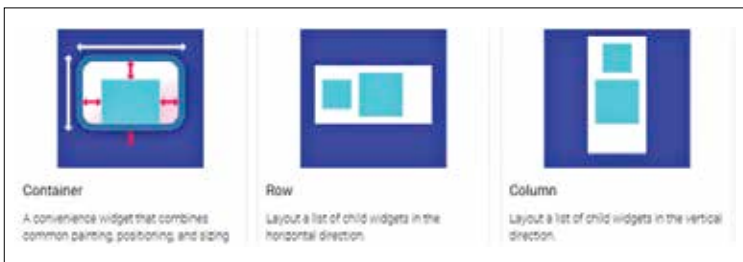

Developing a chat room requires the layout. So, make priorities for messages in the body. Here, TopAppBar eases your tasks. Therefore, you can place text input and send button using the Row and Column.

You can get your layout right once you put your format within each Row/Column and with the right assumption on space occupation by these formats using Expanded (flex:x,).

```

class ChatRoom extends StatelessWidget {
  @override
  Widget build(BuildContext context) {
    return Scaffold(
      backgroundColor: Color(0xFFECE5DD),
      appBar: AppBar(...), // Title text, action buttons on
the right
      body: Column(
        children: <Widget>[
          Expanded(

```

Chatroom layout with flutter's column
