

```

• 22 titleLine-
Height,
• 23 child:
Text(chatItem.name),
• 24 ),
• 25 ],
• 26 // ...below remains the same

```

We are close to finishing the design of the AppBar, but it is not done yet. A closer look into your design will show you that the back button is far away from the avatar and title, it needs to be closer to these properties.

Here, you can get some functional ideas from CSS. You can fix the problem using negative margin to wrap children to the Title Widget's left padding. But, negative margin does not exist in Flutter. Use Stack to dissolve Row and use Positioned to place the overflowing children. So, when we are done, we are able to develop a similar customized app bar design just like in WhatsApp.

Whatsapp message bar

Developing of a message bar for Whatsapp Clone

Message bar is an important addition to any chat app. For the cloned ones too, it needs to be incorporated at the right proportion so as to maximize its usability the right way.

In the message bar, there are three icons to be inserted right before the Microphone and Send Button. At the same time, you must pay attention to its rounded corners. ClipRRect in Flutter can help you make the message bar widget rounded. Use larger radius to make the arches of the corner appear clearly.

```

• 1 final roundedContainer = ClipRRect(
• 2   borderRadius: BorderRadius.circular(20.0),
• 3   child: Container(
• 4     color: Colors.white,
• 5     child: Row(
• 6       children: <Widget>[
• 7         SizedBox(width: 8.0),

```
