

performance was not their main suit, but they got the task done. There was another small brother that never came in the limelight, the Raspberry Pi A which began with 128 MB of RAM.

With Raspberry Pi 2, the RAM was up to 1 GB which was a considerable boost and gave a lot of headroom to the users. Even though the next one in line, Raspberry Pi 3 had the same amount of RAM, but it was faster DDR2 this time. The Raspberry Pi Model A+ was directed towards a different user base and had 512 MB of DDR2 RAM to boot. For those curious to know if any extra RAM slots are present to upgrade, sadly there aren't any.

The latest Raspberry Pi 4 has seen the most significant upgrade in this department. It comes in 1 GB, 2 GB, or 4 GB RAM models and it is DDR4, this time running at a mighty 2400 MHz. Irrespective of the RAM variant you opt for, you will get the upgraded DDR4 for your day-to-day needs.

Analog Video Out

If you are looking to connect your display to your Raspberry Pi, the original edition came with a Composite out in its board. They decided to shelf the port soon and the RCA connector jack has since been replaced with 3.5 mm jack or the Unpopulated Pin. Raspberry Pi A+, Raspberry Pi 2, Raspberry Pi 3, and the latest one have the 3.5 mm jack that also acts as the analog video out. Raspberry Pi Zero, Raspberry Pi Zero W, and Raspberry Pi Zero WH carry an unpopulated pin for the same purpose. When it comes to HDMI requirements, all the iterations excluding Raspberry Pi 4 and Raspberry Pi Zero versions have an HDMI port to suffice your video needs as well. The Raspberry Pi Zero series somehow have the HDMI mini port to start. The Raspberry Pi 4 has 2 micro HDMI ports on the board for additional connectivity needs. The latest supports 4K resolution as well.

Analog Audio Out

All of the Pis have the standard 3.5 mm jack as the Analog Audio Out except the Raspberry Pi Zero series. The Raspberry Pi Zero series (Raspberry Pi Zero, Raspberry Pi Zero W, and Raspberry Pi Zero WH) all carry an HDMI audio port which acts as the Analog Audio Out.

General Purpose Input/Output (GPIO) Pins

The Raspberry Pi A+ started with 40 GPIO pins. The upgraded B+ also have the same configurations. The Raspberry Pi B have opted for a 26-pins setting instead. A GPIO input pin is capable of reading 0v to 3V3 worth of
