

input. There are internal pull-up or pull-down resistors which are mostly software-configurable. GPIO2 and GPIO3 are designated pull-up resistors and we configure the rest for doing several tasks as per our requirement.

HDMI

The Raspberry Pi Zero series is much smaller than the traditional size of the other Raspberry Pi models. To compensate for the size limitations, these models come with mini HDMI ports whereas all the elder siblings come with an HDMI port to start things off. The Raspberry Pi 4 saw the introduction of the second HDMI slot in the scheme, but both of them are micro ones and not the traditional HDMI ports.

USB

The Raspberry Pi A+ came with a single USB port. It subsequently became 2x USB 2.0 in the Model B. The ports doubled up to 4 in the Raspberry Pi 2 and Raspberry Pi 3. You can connect additional USB-based devices using a USB hub. The Raspberry Pi Zero and Raspberry Pi Zero W came with a micro USB port, and the Raspberry Pi Zero WH has a micro USB and micro OTG. Like comparisons above, the Raspberry Pi 4 has seen a significant leap in this department as well. For the first time, Raspberry Pi 4 comes equipped with 2 USB 3.0 ports and 2 USB 2.0 ports, which means a significant improvement in reading and writing time can be expected with this model.

LEDs

For the uninitiated, there is Power On/off button on the Raspberry Pi. It is a simple plug-and-play device. For switching it off, you can use the
