

Resistors

One of the most fundamental units of any electric circuit are resistors which are denoted by a zig-zag line between two terminal points. If you follow the international standards, then you can also use a featureless triangle.

Potentiometers/Variable Resistors

Potentiometers and Variable resistors are denoted by putting an inward arrow over the standard resistor symbol.

Capacitors

Capacitors are denoted by 2 symbols; one for non-polarised and the other for polarised. The one denoting two parallel plates is for the non-polarised while the one with one plate bent is for polarised capacitors
