

Raspberry Pi Add on Boards

Do you know that the add-on circuit boards of Raspberry Pi are known as HATs? HAT, which stands for Hardware Attached Top, are the add-on tops and accessories that add functionality to your Raspberry Pi development board.

Below mentioned are some of the best add-ons that can do some amazing things when connected to your Raspberry Pi development board:

1. Camera Module

An official product of the Raspberry Pi foundation, it uses the CSI (Camera Serial Interface) port present on almost all the Raspberry Pi development boards and connects a small camera board to the Pi board via a small ribbon cable. The latest V2 model released earlier this year has an 8-megapixel camera and comes with a superb quality Sony sensor. There is even an IR (Infra-red) version of the same available, which is indeed a rare thing because IR is usually used in wildlife photography.

2. MotoZero

Designed by Richard Saville and manufactured by Pi hut is a controller board which can control up to four motors at once. This add-on is of great significance when doing a project related to Robotics and motors. As the name suggests, MotoZero is a zero-sized PCB and you can program it using the GPIO Zero API (Application Programming Interface).

3. Analog Zero

Analog Zero provides up to eight analogue inputs to
