

2. DHT 11

Perhaps the most popular environmental sensors available for microcontroller projects, DHT 11 is a single wire sensor that can measure both the temperature and the humidity with close to 1 degree Celsius and 1% RH accuracy.

This sensor finds its utility in environmental checking, greenhouses, RH Monitoring vehicles, and weather stations.

3. L9110S H Stepper Controller/ DC Dual Controller

Numerous projects use both standard brushed DC motors and stepper motors but controlling such kind

of devices can be a task in itself, especially with their high current draw so a motor module is a must-have for such projects.

The L9110S has proven to be a fantastic motor controller because it can be used to control either 2 DC motors or 4 wire stepper motors. Researchers and students alike can take advantage of such cheap low-cost module and use it in projects such as robotic arms, RC vehicles, motion tracking systems, and mechanical vehicles.

Conclusion

In this modern-day and age, numerous development boards are available, each catering to either the common versatile demand or some specialised audience. Whichever development board you choose, the key is to determine the best fit for your requirements and program it in such a manner that it functions properly with your project requirements.
