

open-source software. This official software runs on all Arduino Dev boards. So you need to write efficient code and upload it on the board to get it working. You can use this software to install on any machine running Windows, Mac OS X, and Linux.

Raspberry

Many languages have been added Raspberry Pi over time by the creator itself or users who would like to see their preferable language work on these dev boards. This open support offers a dynamic learning environment built around Raspberry Pi. Raspberry Pi Foundation provides Raspbian, a Linux based platform as operating systems with Python and Scratch as the main programming languages. Any language that can be compiled on its ARMv6 chip and they should run smoothly on the Raspberry Pi board.

Raspberry Pi acts as a full-fledged computer that can run multiple programs at once while Arduino is a microcontroller motherboard that acts as a simple computer running one program again and again. Arduino is quite easy to begin with, while Raspberry Pi more preferred for complex tasks.

Here is the list for common Programming Language that we can use to code on Raspberry Pi and Arduino dev boards.

1. Python
2. Scratch
3. C
4. C++
5. Java
6. Node.js
7. JavaScript and JQuery
8. Perl
