

9. Erlang
10. HTML5

Now let's look at each of these languages and what they offer to these development boards.

Programming Language for Raspberry Pi

Raspberry Pi boards can easily be connected with electronic equipment for building smart applications, IoT(Internet Of Things) or any other internet-connected remote solutions. Depending on the applications, there are many programming languages that we can use on Raspberry Pi dev boards.

```

return false;
}

code = curl_easy_setopt(conn, CURLOPT_URL, url);
if (code != CURL_OK)
{
    fprintf(stderr, "Failed to set URL [%s]\n", strerror(
    return false;
}

code = curl_easy_setopt(conn, CURLOPT_FOLLOWLOCATION,
1);
if (code != CURL_OK)
{
    fprintf(stderr, "Failed to set redirect option [%s]\n",
    strerror(errno));
}

const wchar_t *name)
{
    Context *context = (Context *)voidContext;
    if (COMPARE((char *)name, "TITLE"))
        context->addTitle = false;
}

// Text handling helper function
//
static void handleCharacters(Context *context,
const wchar_t *chars,
int length)
{
    if (context->addTitle)
        context->title.append((char *)chars, length);
}

```

Python

Python is one of the recommended languages to work with Raspberry Pi. Even the 'Pi' stands for Python in Raspberry Pi, with their foundation promoting Python as the primary language for programming for configuring these development boards. A vast number of libraries, indentation, and easy-to-read syntax makes Python the standout for beginners to start their footsteps in programming. Mainly for educational and prototyping purposes, Python is used extensively to build applications such as smart home systems, smart plants, IoT based applications, modern desktop, and other online applications.

Scratch

Scratch along with Python is one of the two recommended programming languages from the Raspberry Pi foundation that comes with their OS distribution Raspbian. Lifelong Kindergarten Group built Scratch at MIT Media Lab in Boston with the primary aim to guide beginners to learn computational and mathematical concepts while enjoying their day-to-day activities. This is a visual programming toolkit that aids young programmers to build animation and games with just using a drag and drop interface. The
