

latest version of Scratch even allows complete control of the Raspberry GPIO (General Purpose Input and Output) pins to further aid in executing their code. So one can build their computer games, animations, and interactive playground without actually writing a single piece of code.

C, C++

C is one of the most used programming languages in the world. Raspberry Pi runs on Linux OS, which was written in C, so one can easily write and execute code in these development boards using C. Many top-level programming languages have been influenced by the design of C including Python, Java, and JavaScript among others. Objective C is an extension of C, which is used in building mobile applications for iOS-enabled devices such as iPhones, iPads, and others. C++ enhances the object-oriented features of programming language C, which was the aim of Danish developer Bjarne Stroustrup for building this new language. C++ can be used to perform all sorts of tasks, including hardware design, embedded software, program video games, and numerous graphical applications.

Perl

Due to its flexibility, adaptability and dynamic building elements, Perl a High-level programming language, is often called the *creme de la creme* among other languages. Perl has already been added as a default language to Raspberry Pi dev boards. Perl has a better-organised library structure and ecosystem for writing code. Coding in Perl is more efficient for building automation, analysing and debugging out of a particular code in an application. You can easily update the older version of PERL with the new one for more libraries with better solutions.

Java

Java was a revolution in programming as it was language whose code could run on any operating system, Windows, Mac and Linux machines alike. Although Raspberry Pi runs on Java, code cannot be developed using it. So BlueJ was released in 2013 that once installed, enables programmers to use Java on the development boards. For more information on Blue, see their official site for quick documentation to download and install for different OS.

Founded by James Gosling, Mike Sheridan, and Patrick Naughton, this language is named after Java Coffee as the creator consumed this beverage in large quantities while working on this.
