

Node.js

In recent times, node.js has become one of the most popular options for running server-side JavaScript applications and is highly recommended for writing efficient code on the Raspberry Pi dev boards.

Several libraries and frameworks are available to build feature-rich applications using node.js. When the application requires UI to access remote functionality, Node.js environment is recommended. The standard express framework is mostly used for building web servers using node.js while on-off and RPI-GPIO are considered for enabling GPIO interactions.

JavaScript and JQuery

JavaScript is another popular front-end technology used dominantly along with HTML and CSS for building interactive websites. On-click events, drop-down events, rollover buttons, and numerous features can efficiently be executed with Javascript. When combined with XML to form Ajax, it becomes highly useful in refreshing the content of the website without reloading them. Major IT companies then adapted this useful language to enhance the usability of their online maps for better user experience.

jQuery is a popular library of JavaScript and offers inbuilt functions. With little knowledge of JavaScript programmers can use highly complex web interfaces and interactive components within dev boards. All modern browsers are compatible with running JQuery.

Blockly

Blockly is a Google-supported programming library that offers drag and drops blocks to code visually. Programmers can use these simple features to form a block for their code. These blocks can then easily be exported in other languages such as Python, PHP, Dart, JavaScript, and more, to execute the code.

HTML5

Hyper Text Markup Language or HTML is the basic building block of the internet developed by Tim Berners-Lee while working at CERN in Geneva. And soon
