

the internet engulfed the world with its features. It is used to define the browser for interpreting syntax into a web page.

The latest version of HTML 5 has significant improvements with embedding audio or videos inside web pages and responsive designs to work on multi-platform capabilities such as mobile, smartphones, tablets, and more.

Erlang

Erlang programming language is used when the system can't fail; otherwise, it would spell disaster. Using this language, the same programs run on multiple computers designed in such a way that if anyone fails, the next one takes charge and manages the system or the system never goes down.

For instance, building an air traffic control system for managing airplane movement in the sky, a software to manage a nuclear power plant or any mission-critical situation that might have dire consequences on failing.

Programming Languages for Arduino

Arduino is one of the extensive used simple I/O dev boards that offer several programming languages to connect through its hardware. Arduino is built within C++ only with some domain-specific libraries.

Arduino, along with its software, requires IDE to run on your computer which can be used to write code and upload code to the dev board to get the desired result.

Still, there are many programming languages we can use to code these sophisticated Arduino development boards.

ArduBlock

It is a visual programming tool downloadable as an overlay to the official Arduino IDE. It presents a natural and logical way to write code for visual learners. For those who are getting started in programming, it is the right step towards understanding the code structure.

So if you are short on experience, then ArduBlock is an exceptional tool to write efficient code for your application in Arduino.

One uses the same functions as in their IDE but with minimum writing of code. Even if you are still not ready for learning a programming language, ArduBlock offers a unique perspective for learning the fundamental concepts of logic and coding without getting confused in the complexities of coding.
