

- **Laser printer:** A printer is necessary. If you can arrange to get a high-quality printout, that will work too.
- **Sandpaper- fine-grained:** This is used to make the board rough to make it more susceptible to absorb the pattern.
- **Household tape:** The common tape will be used to keep the pattern attached to the copper board.
- **Scrap cardboard pieces:** This will act as your iron board.
- **Paper towels:** To cover your board before you begin to iron.
- **Iron:** This is the normal clothes iron that you use at home. This iron might also get ruined.
- **Plastic container:** You will be required to wash your board after you have done the ironing.
- **Tweezers:** Optional material but can be used to peel off remnants of the transfer.

For Etching

- **Muriatic acid**
- **Lacquer remover:** Helps to remove the toner once your pattern has been printed.
- **Hydrogen peroxide**
- **Paper towels**
- **Plastic container**
- **Container to dispose of acid**
- **A pair of gloves used for dishwashing**
- **Other protection materials:** These will be for the eyes and nose.
- **Photo papers**
- **Measuring cup**

For DIY- Duino

- **Pieces of wire:** You will need the insulated ones. These should be of all lengths. Keep pliers close by to help you with these.
- **DIP sockets solder tail- 28 pin 0.3**
- **ATmega 328 including Arduino Bootloader**
- **Basic LED(bar graph LEDs can be used, too but we will talk about that in another segment)**
- **A resistor of 330 ohms:** Keep handy a few of these. You will need more than one. Keep a few spare pieces as well.
- **A resistor of 10k ohm:** You will need a few of these too.
