

What Is A Raspberry Pi?

Raspberry Pi Chip

Take a stroll through any school or college today and you'll find enough number of students tackling problems with a tiny kit that comes along with a number of additional materials. Raspberry Pi has taken the educational and entrepreneurial setups by storm because of its pricing and convenience. Students interested in tech no longer have to deal with annoying constraints in getting materials and can actually program a small hardware kit to perform certain functions, just like an actual computer.

The Raspberry Pi is a series of small single-board computers developed by the Raspberry Pi Foundation that was created with the objective of teaching students basic computer science programs for a significantly lesser cost. The basic level chip framework has been a huge hit among developers in the robotics sector and has also stimulated new interests in creating apps and multipurpose IoT applications.

This setup does not include any peripheral devices such as keyboards or mouse but can include some accessories to be added along with the rest of the mainframe.
