

The organisation behind Raspberry Pi consists of two separate departments. The original two models were developed by the Raspberry Pi Foundation. After the Pi Model B was released, the Foundation set up Raspberry Pi Trading to develop the third model, the B+. Raspberry Pi Trading handles the technology while the Foundation helps in spreading its use to schools and institutions at the elementary level in developing countries.

And just how famous has Raspberry Pi become? According to the Raspberry Pi Foundation, more than 19 million units have been sold till now and they have been labelled as a much better alternative to a general-purpose computer. The essential functions of a Raspberry Pi system include the chip framework which can be linked to a computer program and then coded to perform certain functions. Users can then attach hardware components such as LEDs, sensors and even musical instruments to respond to the code. Due to the size of the unit and the scale of operations that can be achieved with the kit, many are even using the original home unit with Arduino Kits for even more applications.

Raspberry Pi Features

Understanding what all is possible with the Raspberry Pi is all about the model of the kit that you choose to use for your undertaking. Don't let its modest size fool you. The original Raspberry Pi sports a RAM space of 256MB and a 700MHz ARM-11 processor. The kit is essentially supposed to work like a miniaturised computer which doesn't leave a whole lot of
