

You can only have a specific number of items with you at a given point of time. The replay value of this game is good, since there are numerous options unexplored, given the vast choices in this game.

The eerie graphics suit the situations presented in the game, backed by soundtracks to match.

Choice of Robots:

Kevin Gold's sci-fi interactive novel is entirely based on text, devoid of graphics, or soundtracks. What powers this game is the power of your imagination.

The story spans over 30 years, right from you making a robot to the day that the robots are the centre of attraction. Your decisions design the robot to be intelligent, empathetic, even emotional, or independent!

The player profile that you choose can be single or married, gay or straight, and the thrill of unlocking 70 achievement keeps you going.

Get your creative juices flowing when you design how the robot appears right to the name that you will christen it with. You can even decide whether you want to start a war or prevent one.

Do you want your robot to be able to swim? Or fly? Which part of the world do you want to be in? What season do you like?

Another thing that is disdainfully captivating is the layout of the story, as in the screen. There are a few illustrations, but the story itself is like a command prompt, where you have to choose the options like in a multiple-choice SAT paper!

The panel on the left, however, shows you the progress that you have made so far. The conclusion is pretty hasty, but the story is already long. So, maybe it is because of some poor choices that lead to the hasty conclusion.
