

Most TikTok video creators are teenagers who are enjoying the experience of making funny videos while dancing, singing and lip syncing to their favorite tunes and filters. TikTok has created a new landscape for sharing online content with a humorous twist. The app seems to be a clear winner in the race between its other social media competitors such as Youtube, Instagram, Facebook, Snapchat and Whatsapp. Content creation and engagement are of equal relevance to content creators and app developers. There is a significant challenge before app developers to keep the content creators also engaged by analysing the data of every feature and page available on the app. The developer plays an important role in the success story of the app as much as content creators. Like any social media platform; developers of TikTok have also emphasised on the importance of analytics to study consumer behavior and maintain its popularity momentum.

TikTok recently launched its Pro account for content creators which provides an in-built infographic analytical dashboard that displays an overview of the content posted. Once the creator opts for the Pro account the app starts recording all the activity. After 7 days, the analytics dashboard provides below insights:

- Profile Overview shows the number of video views, profile views and count of followers which indicates the overall profile performance. The profile viewership gives a daily break up to check what is driving the users to view the profile.
- Content Insights displays all the trending videos posted in the last 7 days. The total number of views, likes, shares and average watch time to the videos indicate the popularity of the content. It gives an in-depth understanding of the content by providing total likes of the post, comments which capture the viewers reaction, number of shares helps to increase the reach and average watch time of the video to judge user engagement.
- Follower Insights provides demographics of the audience along with
