

# CRUD Part - 1

We study the most-used commands, operators and functions of MySQL with their syntax and examples

**C**RUD is a simple acronym for Create, Read, Update, and Delete database records. In this chapter, we will study the most used commands, operators and functions of MySQL with their syntax and example.

### MySQL Queries

A Query is a set of single or multiple requests for information or data from a database table or a combination of multiple tables. A well-written query will result in a simple word, integer, pictures, graphs or even complex analyses.

- Queries use SQL statements and then follow them by a semicolon. (Although there are few exceptions for instance in QUIT.)
