

Similarly, we can select fields from multiple tables too. `SELECT order_details.order_id, customers.customer_name
FROM customers
INNER JOIN order_details
ON customers.customer_id = order_details.customer_id
ORDER BY order_id;`

MySQL Delete Statement

With the DELETE statement in MySQL, we can delete a single record or multiple records in any given table in MySQL. You can also remove rows from a table using the DELETE statement.

```
DELETE FROM table  
[WHERE conditions];
```

Although, the complete Syntax for DELETE is represented as:

```
DELETE [ LOW_PRIORITY ] [ QUICK ] [ IGNORE ] FROM table  
[WHERE conditions]  
[ORDER BY expression [ ASC | DESC ]]  
[LIMIT number_rows];
```

Parameters

- **LOW_PRIORITY:** Optional, but if provided this query or the statement will be delayed until there no processes readings are available from the table.
- **QUICK:** These are optional but if used it makes the deletion faster.
- **IGNORE:** Optional, if provided, all errors during the delete statements are ignored.
- **Table:** Name of the table you wish to delete records from.
- **WHERE conditions:** Optional, though if provided it must be considered for deleting records.
- **ORDER BY expression:** Optional and used in combination with LIMIT to first sort the record in a case limiting the number of records to be deleted.
- **LIMIT:** Optional but if provided, this controls the maximum number of records to delete from a given table.

In the following query example, we are going to delete all records with first_name records with John from the database table.

```
DELETE FROM contacts  
WHERE first_name = 'John';
```

This query removes all records from the contacts where the first_name is John.
