

Similarly, it can be used in combination with other operators and conditions to get specific values.

```
DELETE FROM contacts
WHERE first_name = 'John'
AND user_id < 500;
```

This query will give us all records from the contacts table in the database table where the first name is John and user_id is less than 500 respectively.

MySQL Update Statement

This Update Statement in MySQL is used to update any columns of existing rows within a given table with newer values.

```
UPDATE table
SET column1 = expression1,
    column2 = expression2,
    ...
[WHERE conditions];
```

Although, the complete syntax for MySQL Update is given as:

```
UPDATE [ LOW_PRIORITY ] [ IGNORE ]
table
SET column1 = expression1,
    column2 = expression2,
    ...
[WHERE conditions]
[ORDER BY expression [ ASC | DESC ]]
[LIMIT number_rows];
```

Or, we can use another table to use the update the existing table via:

```
UPDATE table1
SET column1 = (SELECT expression1
                FROM table2
                WHERE conditions)
[WHERE conditions];
```

And for multiple tables with

```
UPDATE table1, table2, ...
SET column1 = expression1,
    column2 = expression2,
    ...
WHERE table1.column = table2.column
AND conditions;
```
