

This query will search for a working hours column with a condition whose values are more than 9 hours. It will retrieve the number of employees who have worked for more than 9 hours in the employees table of the database.

MySQL AVG() Function

The AVG() Function is used to calculate the average value of the given columns. In case there are no rows, the AVG() functions return NULL.

```
SELECT AVG (column_name)
FROM table_name
[WHERE conditions];
```

Parameters:

- **column_name:** Main value of the column name in a given table, the average value you are looking for.
- **table_name:** Table name inside the database from where the records are to be retrieved.
- **WHERE conditions:** This adds any specific conditions to this function that should match the results.

Example:

```
SELECT AVG (working_hour) AS "fullHours"
FROM employees
WHERE working_hour > 9;
```

The query asks for an average of working hours in the employee's table of the database with conditions that the working hours need to be more than 9 hours.

MySQL MIN() Function

The MIN() function is used to return the minimum values from a given column in a respective query.

```
SELECT MIN (column_name)
FROM table_name
[WHERE conditions];
```

Parameters:

- **column_name:** Column name from which the minimum value needs to be retrieved.
- **table_name:** Table name inside the database from where the records are to be retrieved.
- **WHERE conditions:** These are optional values, though added they must be matched in the conditions.
