

```
MySQL> SELECT 3 || 3;
+-----+
| 3 || 3 |
+-----+
|      1 |
+-----+
1 row in set (0.00 sec)
```

MySQL NOT

NOT logical operator takes the expression and then negates or reverses the input.

Syntax: **NOT, !**

NOT Operator will return 1 if the operand is 0, NOT Operator will return 0 if the operand is nonzero, NOT Operator will return NULL if the operands are NOT NULL.

Example:

In the given sample we see that MySQL NOR operator changes the input to 0.

```
SELECT ! 8;
The output will take the form as:
MySQL> SELECT ! 8;
+-----+
| ! 8 |
+-----+
|     0 |
+-----+
1 row in set (0.00 sec)
```

MySQL XOR

XOR operator in MySQL checks the expression and then returns TRUE if one or the other values but not both are TRUE.

Syntax: **XOR**

XOR Logical operator returns NULL when one operand has a NULL value, XOR Logical operator returns 1 when one express in NULL and an odd number are nonzero, XOR operator returns 0 when no operand is NULL & even number of operands is nonzero.

Example:

Here, both the operands have true value so the XOR operator returns FALSE.
