

CRUD Part - 2

Optimisation is important when choosing a production database

If a query involves mistakes, an inefficient query may place a strain on the resources of the production database and cause poor processing or lack of operation. You must change the efficiency of the individual queries when optimising the database server. Even if the most powerful hardware is operating on your database server, it may be impaired by a couple of erroneous questions in its results.

Various clauses are:

1. DISTINCT helps you to remove duplicates from the result.
2. ORDER BY sorts rows based on a column (Default Sort Order is Ascending and use DESC keyword to sort in descending order)
3. LIMIT restricts the number of records returned by the query.
4. Wildcard characters are used to substitute one or more characters in a string.
