

The DISTINCT clause with GROUP BY example

The following method retrieves the data from the same table as used in the previous cases. It shall be used to do this: Class BY and DISTINCT clauses:

```
SELECT DISTINCT(emp_name),emp_id, SUM(emp_sal_paid) As
"Total Paid" FROM sto_emp_salary_paid
GROUP BY emp_name,emp_id;
```

Using the HAVING clause with DISTINCT

You may also incorporate HAVING for tracking by using the GROUP BY clause with DISTINCT. The HAVING clause appears in the illustration above in the following section, and we'll find the documents whose SUM reaches 5000.

```
SELECT DISTINCT(emp_name),emp_id, SUM(emp_sal_paid) As
"Total Paid" FROM sto_emp_salary_paid
GROUP BY emp_name,emp_id
HAVING SUM(emp_sal_paid) > 5000;
```

The DISTINCT clause with ORDER BY example

With the DISTINCT clause SQL ORDER BY can be used to figure out the answer after redundant values have been deleted. See the problem below and the output:

```
SELECT DISTINCT(emp_name) FROM sto_emp_salary_paid
ORDER BY emp_name;
```

Wildcards and LIKE

Wildcards help search data for specific parameters. In combination with the LIKE operator in reference or the NOT LIKE operator, wildcards are used. If you're familiar with SQL, you might assume that you can use the SELECT and WHERE clauses to search for complex data. So why do Wildcards use?

Suppose you can use the following Select statement together with the WHERE clause to receive your requested details from the Marketing department of the Myflix video library in the city of Texas and would like to receive a comment on the number of members registered from Texas.

```
SELECT * FROM members WHERE postal_address = 'Austin ,
TX' OR postal_address = Dallas , TX OR postal_address =
Iola,TX OR postal_adress = Houston ,TX';
```

The "WHERE clause" is complicated, as you can see from the above question. Nonetheless, the use of wildcards simplifies the problem because we can use something basic as the following paragraph.

```
SELECT * FROM members WHERE postal_address like '% TX';
```
