

tandem with the 'xxx' wildcards for any given start sequence, such as one or more characters and '%' for any number of characters that begin at zero (0).

If we want to get all the movies that include the word "code" in the title of the film, we would use the wildcard percentage to do a sequence on both sides of the phrase "code." to fully understand the above argument.

```
SELECT * FROM movies WHERE title LIKE '%code%';
```

The MySQL workbench running the above script for myflix db provides us with the following results.

```
movie_id
title
director
year_released
category_id
4
Code Name Black
Edgar Jimz
2010
NULL
7
Davinci Code
NULL
NULL
6
```

Note: although at the beginning or end of description the search key "secret" appears, it is still returned in the results package. This is because our code contains several characters at first, then follows the template code and at the end many characters. Now, at the beginning of the study requirements only, let's change our script above to include the percentage sheet.

```
SELECT * FROM movies WHERE title LIKE '%code%';
```

The results shown below are given by executing the above script in MySQL against myflixdb.

```
movie_id
title
director
year_released
category_id
7
Davinci Code
```
