

```

$sql = "SELECT * FROM Data LIMIT 2";
$res = $pdo->query($sql);
if ($res->rowCount() > 0) {
    echo "<table>";
    echo "<tr>";
    echo "<th>Firstname</th>";
    echo "<th>Last Name</th>";
    echo "<th>Age</th>";
    echo "</tr>";
    while ($row = $res->fetch()) {
        echo "<tr>";
        echo "<td>".$row['Firstname']. "</td>";
        echo "<td>".$row['Last Name']. "</td>";
        echo "<td>".$row['Age']. "</td>";
        echo "</tr>"; }
    echo "</table>";
    unset($res); }
else {
    echo "No matching records are found."; } }
catch (PDOException $e) {
    die("ERROR: Could not able to execute $sql.
    ".$e->getMessage()); }
unset($pdo);

```

For example, maybe you want fifth to tenth, but in what order fifth to tenth? If you say the ORDER BY clause, the sequence of rows is not understood. Therefore, the LIMIT clause with the ORDER BY clause is a good practice to constrain the result rows in a particular order.

```

SELECT select_list
FROM table_name
ORDER BY order_expression
LIMIT offset, row_count;

```

Using MySQL LIMIT to get the highest or lowest rows

```

SELECT
    customerNumber,
    customerName,
    creditLimit

```
