

```
+-----+
| 122 | 
+-----+
1 row in set (0.00 sec)
```

Suppose every page has 10 rows, you have 13 pages to display 122 customers. Just two rows can be found on the last 13th column. For the first ten clients, this application uses the LIMIT clause for the following rows: 1

```
SELECT
customerNumber,
customerName
FROM
customers
ORDER BY customerName
LIMIT 10;
```

The second-page rows covering rows 11-20 use the LIMIT clause:

```
SELECT
customerNumber,
customerName
FROM
customers
ORDER BY customerName
LIMIT 10, 10;
```

Using MySQL LIMIT to get the nth highest or lowest value

```
SELECT select_list
FROM table_name
ORDER BY sort_expression
LIMIT n-1, 1;
```

The clause LIMIT n-1, 1 returns 1 row starting at the row n. For example, the following finds the customer who has the second-highest credit:

```
SELECT
customerName,
creditLimit
FROM
customers
ORDER BY
creditLimit DESC
LIMIT 1, 1; d
```
