

```

    Public static void main(String args[])
String Str= new string("welcome to computer programming");
System.out.println('e', 'T');    } }

```

Output: We replaced all the alphabets e with capital T and the output of it is wTlcomT to computTr programming

- The string 'replace all' replaces each substring of the given string when it detects a match with the given regular expression i.e. string str.

```

public String replaceAll (String regex, String replace_str)

```

Parameters:

regex: the regular expression to which this string is to be matched.

replace_str: the string which would replace found expression.

```

public class rep2 {
    public static void main(String args[]) {
        // Initialising String
String Str = new String("Welcome to computer programming");
// original string
System.out.print("Original String : " );
System.out.println(Str);    } }
System.out.println(str.replaceAll("(.*)computer(.*)" ,
"XYZ"))";    } }

```

Output: Original string: Welcome to computer programming

Replaced string: XYZ

- The string function 'replace first' replaces the first substring of the given string that matches the regular expression given replace_str.

```

Public string replaceFirst (string regex, string replace_str)

```

Parameters:

Regex: regex is the regular expression the string is to be matched with.

Replace_str: would replace the expression it finds a match with.

Working method:

```

public class rep3 {
    public static void main(String args[]) {
        // Initialising String
String Str = new String("Welcome to computer programming");
// original string
System.out.print("Original String : " );
System.out.println(Str);
System.out.println(Str.replaceFirst ("programming" ,
"XYZ"));    } }

```
