

create our functions of our own in order to find it by scanning all the characters in the string if the character isn't a null character then increment the counter by one. Once the null character finds the counter equals the length of the string.

```
include <stdio.h>
int main()
{
    char s[1000];
    int c = 0;
    printf("Input a string\n");
    gets(s);
    while (s[c] != '\0')
        c++;
    printf("Length of the string: %d\n", c);
    return 0; }
```

Function to find string length:

```
int string_length(char s[]) {
    int c = 0;
    while (s[c] != '\0')
        c++;
    return c; }
```

C program to find length of a string using recursion

```
#include <stdio.h>
int string_length(char [], int);
int main()
{
    char s[100];
    int l = 0; // Length is initialized to zero
    gets(s);
    printf("Length = %d\n", string_length(s, l));
    return 0; }
int string_length(char s[], int l) {
    if (s[l] == '\0') // Base condition
        return l;
    l++;
    return (string_length(s, l)); }
```

Function to find string length by the use of pointers

```
int string_length(char *s) {
    int c = 0;
```
