

- MySQL Left Join (Also called Left Outer Join)
- MySQL Right Join (Also called Right Outer Join)
- MySQL Cross Join
- MySQL Straight Join
- MySQL Natural Join

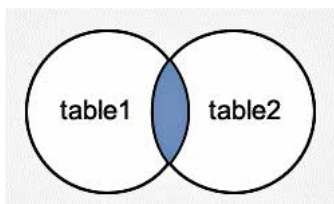

MySQL Inner Join

Also known simply as Join, and the most common type of Join where it combines data from two or more given tables that matches the condition.

```
SELECT columns
FROM table1
INNER JOIN table2
ON table1.column = table2.column;
```

Here is a default image showing MySQL Inner Join(shaded) from given table1 and table2. So, intersecting areas or the common area of two tables will be the result of the Inner join query.

Here ON Clause plays a significant role to match the records in tables depending on the value of column id. So, with MySQL INNERJoin, you will get the result from two tables if and only if both tables match the conditions as specified in the ON clause.

Inner Join depicted in the shaded region

For example, here there are two specific tables for suppliers and orders. Then the query asks for the Suppliers table to join with the orders table at point where Supplier ID and order supplier Id match.

SUPPLIER_ID	SUPPLIER_NAME
90000	IBM
90001	Hewlett Packard
90002	Microsoft
90003	NVIDIA

And the order table with data values as:

ORDER_ID	SUPPLIER_ID	ORDER_DATE
500151	90000	2019/11/22
