

MySQL Cross Join

In the MySQL Cross Join, the result is directly a cartesian product of the two tables where products of rows from one table are done to another table.

```
SELECT table2.column1, table2.column2,..., table1.
column1, table 1.column 2m...
FROM table1
CROSS JOIN table2;
```

We are given a sample table with three tables as in the image. We are going to use a MySQL CROSS Join on the following table with this statement:

table11		table12			table13	
id	aval1	id	bval1	bval2	id	cval1
1	405	701	405	16	3	17
2	401	704	409	14	2	12
3	200	706	403	13	5	15
4	400	709	401	12	1	16

```
SELECT table 112.
id,table 112.val1,table 112.bl2,
table111.id,table111.aval1
FROM table112
CROSS JOIN table111;
```

As table111 and table112 are then Cross joined to get the specific result. Output will be as:

I VAL1	VAL2	ID	AVAL1	
701	405	16	1	405
704	409	14	1	405
706	403	13	1	405
709	401	12	1	405
701	405	16	2	401
704	409	14	2	401
706	403	13	2	401
709	401	12	2	401
701	405	16	3	200
704	409	14	3	200
706	403	13	3	200
