

709	401	12	3	200
701	405	16	4	400
704	409	14	4	400
706	403	13	4	400
709	401	12	4	400

16 rows in set (0.05 sec)

All the rows from one table are matched with others to get the specific results.

MySQL Straight Join

In this Straight Join in MySQL, it just scans and combines all the matching rows in the given tables. Its behaviour is the same as that of INNER Join as the left table is first read before proceeding for the right table.

```
SELECT * FROM table1
STRAIGHT JOIN table2;
```

Here we can add conditions to get particular results from the join.

Here we are considering two tables for this MySQL Straight Join example with table_A and table_B. Now we are going to use Straight join using the following query:

```
SELECT * FROM table_A
STRAIGHT JOIN table_B;
```

Here the output will be represented as:

You can see one by one all the values of both tables are used to get the result for Straight Join.

A	M	A	N
1	m	2	p
2	n	3	q
4	o	5	r

table_A table_B

Output

A	M	A	N
1	m	2	p
2	n	2	p
4	o	2	p
1	m	3	q
2	n	3	q
4	o	3	q
1	m	5	r
2	n	5	r
4	o	5	r

MySQL Natural Join

A Natural Join matches the columns of the two tables similarly like an INNER or LEFT join with ON clause referring to all the matching columns that tables need to have to common for getting a result. So in way columns with the same name in the associated tables will be appearing once only.
