

```
SELECT column1, column2, column3
FROM table1
NATURAL JOIN table2;
```

You can add various conditions depending on the requirement to match your result thereafter. The following are guidelines for Natural Join.

- Associated tables need to have at least one or more pairs of similar columns.
- Don't ever use ON Clause within a NATURAL Join.
- Columns used inside the table must have the same data type for join to work effectively.

Here, as an example,

we are taking tables as per the following image with ids and values as:

Now we will apply a Natural Join using the following query.

table111		table112			table113	
id	aval1	id	bval1	bval2	id	cval1
1	405	701	405	16	3	17
2	401	704	409	14	2	12
3	200	706	403	13	5	15
4	400	709	401	12	1	16

```
SELECT id, aval1, cval1
FROM table111
NATURAL JOIN table113;
```

OR

The same process can be done using an INNER JOIN with ON clause too.

```
SELECT table1111.id, table111.aval1, table113.cval1
FROM table111
INNER JOIN table113
ON table111.id=table113.id;
```

And the outcome will be the same:

```
mysql> SELECT id, aval1, cval1
-> FROM table111
-> NATURAL JOIN table113;
```

ID	AVAL1	CVAL1
3	200	17
2	401	12
1	405	16

3 rows in set (0.00 sec)
