

5	Eliza	Clifford	Software Engineer	4750
6	Nancy	Newman	Software Engineer	5100
7	Melinda	Clifford	Project Manager	8500
8	Harley	Gilbert	Software Architect	8000

And the second as education table:

id	name
1	BSc
2	MSc
3	PhD

So there is a relation here as Robin and Taylor both have BSc whereas Vivian individually has both PhD and MSc. These relationships can be graphically shown as below:

Here we can see, multiple records in one table have a relation to multiple records in another table. A new table `employee_education` can be used to establish a relation between these two tables.

Here is the statement for writing this many-to-many relationship for these two tables.

```
SELECT emp.first_name, emp.last_name, edu.name AS edu_name
FROM `employee` AS emp LEFT JOIN `employee_education` AS
ee ON emp.id = ee.employee_id LEFT JOIN `education` AS edu
ON ee.education_id = edu.id;
```

And the output will be followed:
