

MySQL DIY

Now that you have familiarised yourself with how CRUD functions, let's create a DIY web-app

Today we will be building a simple web application with a local database to store and retrieve data. We will be using PHP and MySQL. To reinforce what you have learned in the earlier sections, here is an example of a CRUD application. Let us consider the case of a database of employees for XYZ Company. There would be an admin who can add the name of new employees (Create) and view the entire list of employees (Read). He can also edit the salary of any particular employee (Update), and if the need is, he can delete the credentials of an employee who resigned (Delete).

Here are some prerequisites that you must cater before getting started –

- Basic HTML Knowledge to understand the HTML Forms being used.
- Basic PHP understanding to gauge how the strings and variables operate.
