

```
initial-scale=1" />
• <title>Simple Database App</title>
• <link rel="stylesheet" href="css/style.css" />
• </head>
• <body>
• <h1>Simple Database App</h1>
• <ul><li><a href="create.php"><strong>Create</strong></a> -
create a user
• </li><li><a href="read.php"><strong>Read</strong></a> -
search for a user
• </li> </ul> </body>
• </html>
```

The code above will create a homepage that will be located at index.php. It will also create a basic HTML structure that links to our create and read pages. Switch over to the database, and you will find these two options. After that, we will create a templates/ directory in our public/ folder, which will have a header.php and footer.php. Anything that belongs to the h1 tag and above should be in the header. Insert the following in the header.php -

```
• <!DOCTYPE html>
• <html lang="en">
• <head>
• <meta charset="utf-8" />
• <meta http-equiv="x-ua-compatible" content="ie=edge" />
• <meta name="viewport" content="width=device-width,
initial-scale=1" />
• <title>Simple Database App</title>
• <link rel="stylesheet" href="css/style.css" />
• </head>
• <body>
• <h1>Simple Database App</h1>
• </body>
• </html>
• To create the footer, write the following in the footer.
php -
• </body>
• </html>
```

To make the header and the footer code reusable throughout the schema, insert the following code in index.php -

```
• <?php include "templates/header.php"; ?>
• <ul><li><a href="create.php"><strong>Create</strong></a> - add a user
```
