

- `</li><li><a href="read.php"><strong>Read</strong></a>` - find a user
- `</li></ul>`
- `<?php include "templates/footer.php"; ?>`

The php include function will ensure that all the pages will now include a header and footer.

Adding a New User Page

Since we have completed the basic structure and the headers and footers, it is time to add a create.php to our public/ directory. It will be used to create a new page for every user that enters the database. The code:

- `<?php include "templates/header.php"; ?>`
- `<?php include "templates/footer.php"; ?>`

After loading the basics, we will create a form that consists of the last name, first name, age, location, and email address of the employee. For such forms, it is essential to create labels and to allocate a value to each tag. It will allow multiple users to enter their credentials without overlapping. PHP identifies and utilises the data of the input using the name attribute, which makes it necessary for us to create both the id and name attributes for each user. Here is the code -

- `<?php include "templates/header.php"; ?><h2>Add a user</h2>`
- `<form method="post">`
- `<label for="last name">Last Name</label>`
- `<input type="text" name="lastname"`
- `id="lastname">`
- `<label for="firstname">First Name</label>`
- `<input type="text" name="firstname"`
- `id="firstname">`
- `<label for="age">Age</label>`
- `<input type="text" name="age" id="age">`
- `<label for="location">Location</label>`
- `<input type="text" name="location"`
- `id="location">`
- `<label for="Email">Email Address</label>`
- `<input type="text" name="email" id="email">`
- `<input type="submit" name="submit"`
- `value="Submit">`
- `</form>`
- `<a href="index.php">Back to home</a>`
- `<?php include "templates/footer.php"; ?>`

If you run the code, you would see that on the front end, there is a form now which accepts the values as we have allowed it to, but the Submit button won't
