

do anything as of now. We have to write a code for it to process and save the data on to the database. Side Note – A style.css to improve the page viewing experience. You can make the forms more comfortable to read to improve the viewing experience at the front end by including a simple code. For that, create a css/ folder and insert style.css. Here is the snippet –

- label {
- display: block;
- margin: 5px 0; }
- After all of it, here is how your front end code should stack up –
- public/
- |-- css/
- | |-- style.css
- |-- templates/
- | |-- header.php
- | |-- footer.php
- |-- index.php
- |-- create.php
- |-- read.php

Part 2 – Initialising the Database

The front end setup is ready, and you must have seen how it looks. It is time we begin our database creation process. We are using SQL statements and PHP in the installer script. Open the Sequel Pro or SQLYog as applicable. Switch to the Login Page. You will find your host to be 127.0.0.1 or localhost. In the Username and Password fields, enter root. Click on Connect to open the localhost.

After that, create a directory named database/ and a file init.sql in it. We will then create a database named data1 usable for the code. As we are creating a database with employee data, here are the fields that we will build – Employee ID, last name, first name, age, location, email, and date. Here is the code snippet –

- CREATE DATABASE test;
- use data1;
- CREATE TABLE users (
- ID INT(11) UNSIGNED AUTO_INCREMENT PRIMARY KEY,
- lastname VARCHAR(30) NOT NULL,
- firstname VARCHAR(30) NOT NULL,
- age INT(3),
- location VARCHAR(50),
- email VARCHAR(50) NOT NULL
- date TIMESTAMP);
