

Part 3 – Inserting a New User

We can now conclude that the structure is ready, and it is time to begin accepting entries. We will initiate with public/create.php, where we will add a code that will inform us if the entry has been submitted or not.

- `if (isset($_POST['submit'])) {}`

The `$_POST` array is the one that accepts all the inputs in PHP. In addition to the above code, use the try/catch code to look for any exceptions. We then bring in `$dsn` to make sure the integration is complete.

- `if (isset($_POST['submit'])) {`
- `require "../config.php";`
- `try {`
- `$newconnection = new PDO($dsn, $username and $pass-`
`word, $options);`
- `// insert new user code will go here`
- `} catch(PDOException $error) {`
- `echo $sql . "<br>" . $error->getMessage(); }`

After that, we begin our array creation with the help of all the submitted values.

- `$new_user = array(`
- `"lastname" => $_POST['firstname'],`
- `"firstname" => $_POST['last name'],`
- `"age" => $_POST['age'],`
- `"location" => $_POST['location']`
- `"email" => $_POST['email'], );`

After that, it is what the SQL code will look like –

INSERT INTO users (first name, last name, email, age, location) values (:last name, :firstname, :age, :location, :email)

You can choose to insert the values by hand or add in a code to simplify –

- `$sql = sprintf(`
- `"INSERT INTO %s (%s) values (%s)",`
- `"users",`
- `implode(", ", array_keys($new_user)),`
- `":" . implode(", :", array_keys($new_user)) );`

If we execute the code, this is how it will look –

- `$statement = $connection->prepare($sql);`
- `$statement->execute($new_user);`

It is how the full code will look like in the try block –

- `$connection = new PDO($dsn, $username and $password,`
`$options);`
