

Part 7 – Deleting Entries

What if we entered the wrong variable or the values were incorrect, and we want to delete the entry altogether? MySQL allows its users to delete an entry using the `delete.php` function. We will go back to `index.php` present in the public folder and enter the following code –

```

- <ul><li><a href="create.php"><strong>Create</strong></a> - add user </li>
- <li><a href="read.php"><strong>Read</strong></a> - find user </li>
- <li><a href="update.php"><strong>Update</strong></a> - edit user </li>
- <li><a href="delete.php"><strong>Delete</strong></a> - delete user </li>
- </ul>

```

The delete function is the simplest of the CRUD functions. Data is not deleted permanently from the database. They will be hidden in MySQL. Looking at how difficult it is to modify data, you can use delete function with select function to delete an entry instead of editing it. Here is the code on a Google Doc (Section 2) – <https://dgit.in/FTJan2020Code>

Conclusion

MySQL is a vast world, and this was a basic DIY example. We hope that you do not find it overwhelming and continue to learn. There are innumerable codes to learn, and you would learn to use them better as you continue to venture. It is the simplest of the CRUD examples, and there is a lot of fun to follow.
