

Geometry editing mode and Foliage mode. These modes are discussed in detail further in the article.

- **World Outliner:** True to its name, the world outliner presents the names of all the Actors who are a part of that particular scene. They are presented in hierarchical order and can be edited, modified and worked with using the world outliner directly. There is no need for any other windows if the world outliner is open.
- **Layers:** Layers help the designers to transport Actors. This helps them keep the layers clutter-free. They can just keep the Actors they are working with and remove the ones that are no longer needed. Layering helps the designers work better by reducing confusion as to the properties of the Actors.

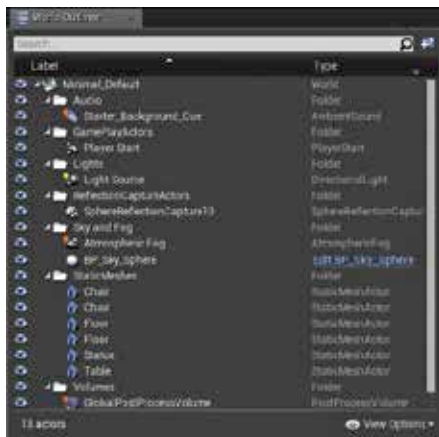

The different modes of operating the level editor

The Level Editor is all about incorporating Actors into a game. This can be quite a tedious task to do. However, the features of the tool make it relatively easier to hop, skip, and jump from one panel to another.

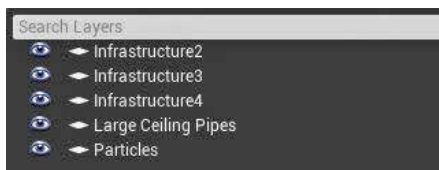

The functionality of the Level Editor is, thus, more than just the basic formulation of the game.

In order to attain its final goal of producing a perfect model, it has modes. These modes help the tool to switch from a generalised version of creating and putting in Actors, to more specific things like placing the Actors, or painting something, and so on and so forth.

- **The Place Mode:** The Place Mode is responsible for pacing up the process of placing the Actors into their layers. It is responsible for making the creation of the environment, comparatively easier. It is
