

- **The Landscape Mode:** The Landscape mode is extensively used to create the terrains of the game. It is the tool that is used to design the rugged mountains, plateaus, and all other landscapes that are present in a particular game. This, in turn, has several modes, too.
- **Manage Mode:** Manage mode is used to modify and create new landscapes. It also provides the facility to copy and paste certain pre-existing landscapes to the new level.
- **Sculpt Mode:** The Sculpt mode allows the designers to modify the shape of the landscapes. This is done by selecting and using certain specific tools.
- **Paint Mode:** The Paint mode is quite an interesting one. It allows the designers to paint the existing landscapes, and thus, to give them whatever look the designers desire.
- **The Foliage Mode:** The Foliage mode is all about speed and efficiency. It allows the designers to paint or erase certain sets. These sets are present in Static Meshes when the Actors are under the influence of filters.
- **The Geometry Editing Mode:** The most basic level editing tool present in Unreal is this Geometry Editing mode. This is used to carve out the Actors or landscapes from empty space present in the levels.

Exploring the properties/details panel for each object.

The Details panel is all about providing information, especially the ones pertaining to the functions which are specific to the particular selection present on the viewport. This panel contains a number of useful tools, including the ones that are required to transform and edit the Actors. With the help of this panel, the actors can be rotated and scaled as per the designer's wishes. It also provides a quick access method to the designers, depending upon the Actors visible on the viewport. This extra functionality is to ensure a quick editing process that will be effective in the final design of the Actors and will be an efficient process, too.

The Details Panel has a number of attributes that we will see here.
