

Panel. Once the names have been set, these can then be used to find the respective characters.

Search Filters

The Search Filter is quite convenient to use. When one types in the property that he/she wishes to access, it begins filtering so as to match the text it is receiving from them. Finally, only those properties which completely match the text entered are shown on the screen. This makes the process a faster one, cutting out the time that is needed to search for something manually.

Favourites

This is yet another interesting feature of the Details Panel. Favourites refers to the characters and their properties which one is prone to changing more number of times. Adding these properties to Favourites grants the designers quick access to change the same.

Default Values

As is evident from the name itself, Default Values refer to the properties that are set by default, before any special properties are set by the designers.

Edit Conditions

In Level Editor, properties can have one of two states- enabled or disabled. By default, the properties are enabled. However, this is true unless some property has an edit condition. When a property has an edit condition latched on to it, the particular property cannot then be decided upon independently. It is then dependent on some other property.

EditConst Properties

This too, much like its name, refers to those properties that cannot be edited any further. These properties and values are highlighted to ensure that the designer knows the values are constant.

Property Controls

Property controls help in determining the controls of the properties of each Actor. The list below has the types of controls that fall under this category:

- Basic controls
- Reference Object controls
