

A glimpse of actors creation on Unreal

Source: <https://docs.unrealengine.com/en-US/Engine/Content/Types/SkeletalMeshes/SkeletalMeshConversion/index.html>

StaticMesh VS SkeletalMesh

StaticMeshActor	SkeletalMeshActor
A StaticMeshActor is a simple actor that is used to show a mesh inside the scene of your game. Although, from the first read it might suggest that the actor is static, it is only that the mesh is static, hence StaticMesh.	Completely opposite to the StaticMeshActors, SkeletalMeshActors are the ones whose geometry can be deformed using animation sequences that are generally created and exported from third party external 3D animation software.
The Mesh is static in the sense that the geometry of the mesh inside the given scene doesn't change no matter how much the gameplay changes.	The Mesh is static in the sense that the geometry of this mesh inside the given scene can change as per how the gameplay permits.
As far as actors are concerned, they can be changed and modified through the gameplay.	Actors can be changed and modified through the SkeletalMeshGeometry and not gameplay.
These kinds of actors mostly find their use in geometrical worlds, mostly to describe the background environments of gameplay.	These kinds of actors are used for anything that needs to deform or depict mechanical processes of machinery. So, they are generally used to depict characters and living creatures, plus complex types of machineries like robots or chainsaws. Sporadically, they also find their usage when combined with Matinee to create Cinematic experiences.
